## Synopsis

This continuing series explores different diseases to show the science behind how disease-causing organisms affect the body. Microorganisms have plagued humans since the beginning of time, causing debilitating diseases and even death. But how, exactly, do these microorganisms infect and cause disease? The books in this series examine various microbiological scourges that have affected humans as well as the steps that have been taken to identify, isolate, prevent, and eradicate them. Each title will outline the history and treatments of the diseases, highlighting how improvements in prevention and treatment techniques have affected the disease's impact on the world population. Hantavirus pulmonary syndrome (HPS) is a deadly disease transmitted by infected rodents through urine, droppings, or saliva. Humans can contract the disease when they breathe in the virus from the air.

Alcamo is a professor of biology at the State University of New York. He has taught at the college level for over thirty years, specializing in biology for health science students.

For the novice population. Where is the chapter or even section about Old World Hantavirus? Could explain key differences between Old World and New World. Other than that I was content with the material.
